```
In [1]: import graphonlib  
import numpy as np
```

```
In [19]: # first, we create a simple blockmodel graphon  
w = graphonlib.graphons.make_hierarchical_blockmodel_graphon(1, [.3, .8])
```

```
In [20]: graphonlib.plot_graphon(w)
```

```
In [25]: # next, we generate a discrete edge probability matrix, p  
grid = np.linspace(0, 1, 100)  
p = graphonlib.evaluate(w, grid)
```

```
In [26]: # then we sample a random adjacency matrix  
a = graphonlib.sample_edges(p)
```

```
In [28]: graphonlib.plot_adjacency(a)
```

```
In [34]: # now we smooth
# parameters:
#     h : neighborhood size parameter. Example: 0.3 means to include
#         closest 30th percentile of neighbors in neighborhood
p_zhang = graphonlib.smoothing.zhang.smoother(a, h=0.3)
```

```
In [35]: graphonlib.plot_adjacency(p_zhang)
```
